Description

MAU (Machinery space Accumulator Unit) consists of water cylinder fully interconnected and powered by a pressurized nitrogen cylinder. The nitrogen cylinder is not supplied as local cylinders are recommended because of the national regulations. In stand-by situation, the water cylinder and the piping system are not pressurized. Upon actuation the unit will discharge on a continuous basis for the duration of discharge through the stainless steel piping and the HI-FOG spray heads.

The system activation can be done remotely or manually depending on the actuator valve. Once released, the nitrogen forces the water from cylinder to piping system and to spray heads. The discharge is normally designed for a 10 minute period.

For further information, see related documents: Dimensional Drawing no. DHAUMA000111A (MAU 50 WM)
